# Sequencing Legal DNA NLP for Law and Political Economy

2. Tokens and N-Grams

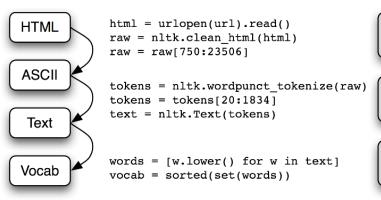

#### Overview

- ► These slides describe the process of transforming a corpus into numerical data that can be used in statistical analysis.
- Input:
  - ► A set of documents (e.g. text files), *D*.
- Output:
  - ▶ A matrix, X, containing statistics about word/phrase frequencies in those documents.

#### Goals of Featurization

- ▶ To summarize: A major goal of featurization is to produce features that are
  - predictive in the learning task
  - ▶ interpretable by human investigators
  - ► tractable enough to be easy to work with

#### The NLP Pipeline

Download web page, strip HTML if necessary, trim to desired content

Tokenize the text, select tokens of interest, create an NLTK text

Normalize the words, build the vocabulary

Source: NLTK Book, Chapter 3.

- ► There are three homework assignments
  - upload to assignment dropbox (see syllabus), first one is due March 11th

- There are three homework assignments
  - ▶ upload to assignment dropbox (see syllabus), first one is due March 11th
- Option A: Two Response Essays
  - read and discuss/critique two of the Applications readings
    - ▶ 250+ words (half -page to a page) eac

- There are three homework assignments
  - upload to assignment dropbox (see syllabus), first one is due March 11th

#### Option A: Two Response Essays

- read and discuss/critique two of the Applications readings
  - ▶ 250+ words (half -page to a page) eac
- ▶ We will post anonymized essays to the forum; part of the grade is voting/commenting on other students' essays.

- There are three homework assignments
  - upload to assignment dropbox (see syllabus), first one is due March 11th

#### Option A: Two Response Essays

- read and discuss/critique two of the Applications readings
  - ▶ 250+ words (half -page to a page) eac
- ▶ We will post anonymized essays to the forum; part of the grade is voting/commenting on other students' essays.

#### Option B: Code Replication Exercise

- replicate analysis from a listed paper (either Methods or Applications).
  - If code is already available, have to apply it to new data.
- Can be done in groups of two students.

- There are three homework assignments
  - upload to assignment dropbox (see syllabus), first one is due March 11th

#### Option A: Two Response Essays

- read and discuss/critique two of the Applications readings
  - ▶ 250+ words (half -page to a page) eac
- ▶ We will post anonymized essays to the forum; part of the grade is voting/commenting on other students' essays.

#### Option B: Code Replication Exercise

- replicate analysis from a listed paper (either Methods or Applications).
  - If code is already available, have to apply it to new data.
- Can be done in groups of two students.

#### Option C: Problem Sets

challenging problem sets for students who want coding practice.

- There are three homework assignments
  - upload to assignment dropbox (see syllabus), first one is due March 11th

#### Option A: Two Response Essays

- read and discuss/critique two of the Applications readings
  - ▶ 250+ words (half -page to a page) eac
- ▶ We will post anonymized essays to the forum; part of the grade is voting/commenting on other students' essays.

#### Option B: Code Replication Exercise

- replicate analysis from a listed paper (either Methods or Applications).
  - If code is already available, have to apply it to new data.
- Can be done in groups of two students.

#### Option C: Problem Sets

- challenging problem sets for students who want coding practice.
- ► Can also do **A/C hybrid**: do one response essay, plus any 4 questions from problem set.

#### Outline

Basic Text Processing

Counts and Frequencies

N-Grams

Parts of Speech

Applications

## Split into paragraphs/sentences

- Many tasks should be done on sentences, rather than corpora as a whole.
  - ► NLTK and spaCy do a good (but not perfect) job of splitting sentences, while accounting for periods on abbreviations, etc.
  - spaCy is slower but significantly better.

## Split into paragraphs/sentences

- Many tasks should be done on sentences, rather than corpora as a whole.
  - ► NLTK and spaCy do a good (but not perfect) job of splitting sentences, while accounting for periods on abbreviations, etc.
  - spaCy is slower but significantly better.
- ► There isn't a grammar-based paragraph tokenizer.
  - most corpora have new paragraphs annotated.
  - or use line breaks.

## Pre-processing

- ▶ An important piece of the "art" of text analysis is deciding what data to throw out.
  - Uninformative data add noise and reduce statistical precision.
  - ► They are also computationally costly.

#### Pre-processing

- ► An important piece of the "art" of text analysis is deciding what data to throw out.
  - Uninformative data add noise and reduce statistical precision.
  - They are also computationally costly.
- ▶ Pre-processing choices can affect down-stream results, especially in unsupervised learning tasks (Denny and Spirling 2017).
  - some features are more interpretable: "judge has" / "has discretion" vs "judge has discretion".

- Removing capitalization is a standard corpus normalization technique
  - ▶ usually the capitalized/non-capitalized version of a word are equivalent e.g. words showing up capitalized at beginning of sentence
  - ightharpoonup ightharpoonup capitalization not informative.

- Removing capitalization is a standard corpus normalization technique
  - ▶ usually the capitalized/non-capitalized version of a word are equivalent e.g. words showing up capitalized at beginning of sentence
  - ightharpoonup ightharpoonup capitalization not informative.
  - but what about "the first amendment" versus "the First Amendment"?

- Removing capitalization is a standard corpus normalization technique
  - ▶ usually the capitalized/non-capitalized version of a word are equivalent e.g. words showing up capitalized at beginning of sentence
  - ightharpoonup ightharpoonup capitalization not informative.
  - but what about "the first amendment" versus "the First Amendment"?
- ▶ Compromise: include capitalized version of words not at beginning of sentence.

- Removing capitalization is a standard corpus normalization technique
  - ▶ usually the capitalized/non-capitalized version of a word are equivalent e.g. words showing up capitalized at beginning of sentence
  - ightharpoonup ightharpoonup capitalization not informative.
  - but what about "the first amendment" versus "the First Amendment"?
- Compromise: include capitalized version of words not at beginning of sentence.
- ► For some tasks this is important e.g. text generation.
  - Modern tokenizers take out capitalization but then add a "capitalized" token before the word.

#### Punctuation

## Let's eat grandpa. Let's eat, grandpa.

correct punctuation can save a person's life.

Source: Chris Bail text data slides.

- inclusion of punctuation is a similar choice to capitalization.
  - usually, not informative but needed for text generation, for example.

#### Numbers

*1871* 

*1949* 

*1990* 

► can drop numbers, or replace with special characters; can encode magnitude for example.

Source: Chris Bail text data slides.

## Drop Stopwords?

as at be by for and are from а an he it its of on that the has in is will with to was were

## **Drop Stopwords?**

```
be by
           and
                                          for
                                                from
а
     an
                 are
                       as
                             at
has
     he
                 is
                       it
                             its of
                                          that
                                                the
                                      on
                 will
                       with
to
     was
           were
```

- ▶ What about "not guilty"?
- ▶ Legal "memes" often contain stopwords:
  - "beyond a reasonable doubt"
  - "with all deliberate speed"

#### Drop Stopwords?

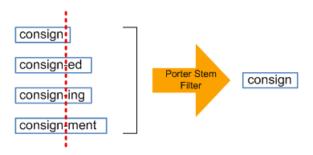

```
а
     an
           and
                  are
                        as
                              at
                                  be by
                                            for
                                                  from
has
                                  of
     he
                  is
                       it
                              its
                                       on
                                            that
                                                  the
                  will
                       with
to
           were
     was
```

- ► What about "not guilty"?
- ► Legal "memes" often contain stopwords:
  - "beyond a reasonable doubt"
  - "with all deliberate speed"
- can drop stopwords by themselves, but keep them as part of phrases.
- can filter out words and phrases using part-of-speech tags (later).

## Stopwords lists (Kelly et al 2018)

```

## Stemming/lemmatizing

- ▶ Porter Stemmer is more aggressive than Snowball Stemmer.
- ▶ Lemmatizer produces real words, but N-grams won't make grammatical sense
  - e.g., "judges have been ruling" would become "judge have be rule"

#### Outline

Basic Text Processing

Counts and Frequencies

N-Grams

Parts of Speech

Applications

## Bag-of-words representation

- Recall the goal of this lecture:
  - Convert a corpus D to a matrix X
- ▶ In the "bag-of-words" representation, a row of *X* is just the frequency distribution over words in the document corresponding to that row.

## Counts and frequencies

- **Document counts**: number of documents where a token appears.
- ▶ **Term counts**: number of total appearances of a token in corpus.

## Counts and frequencies

- **Document counts**: number of documents where a token appears.
- ▶ **Term counts**: number of total appearances of a token in corpus.
- Term frequency:

Term Frequency in document  $k = \frac{\text{Term count in document } k}{\text{Total tokens in document } k}$ 

## Building a vocabulary

- ▶ An important featurization step is to build a vocabulary of words:
  - ► Compute document frequencies for all words
  - ▶ Inspect low-frequency words and determine a minimum document threshold.
    - e.g., 10 documents, or .25% of documents.

## Building a vocabulary

- ► An important featurization step is to build a vocabulary of words:
  - ► Compute document frequencies for all words
  - ▶ Inspect low-frequency words and determine a minimum document threshold.
    - e.g., 10 documents, or .25% of documents.
- Can also impose more complex thresholds, e.g.:
  - appears twice in at least 20 documents
  - appears in at least 3 documents in at least 5 years

## Building a vocabulary

- ► An important featurization step is to build a vocabulary of words:
  - ► Compute document frequencies for all words
  - ▶ Inspect low-frequency words and determine a minimum document threshold.
    - e.g., 10 documents, or .25% of documents.
- Can also impose more complex thresholds, e.g.:
  - > appears twice in at least 20 documents
  - appears in at least 3 documents in at least 5 years
- Assign numerical identifiers to tokens to increase speed and reduce disk usage.

## TF-IDF Weighting

- ► TF/IDF: "Term-Frequency / Inverse-Document-Frequency."
- ▶ The formula for word w in document k:

## TF-IDF Weighting

- TF/IDF: "Term-Frequency / Inverse-Document-Frequency."
- ▶ The formula for word w in document k:

$$\underbrace{\frac{\text{Count of } w \text{ in } k}{\text{Total word count of } k}}_{\text{Term Frequency}} \times \underbrace{\log(\frac{\text{Number of documents in } D}{\text{Count of documents containing } w})}_{\text{Inverse Document Frequency}}$$

- The formula up-weights relatively rare words that do not appear in all documents.
  - These words are probably more distinctive of topics or differences between documents.
  - Example: A document contains 100 words, and the word appears 3 times in the document. The TF is .03. The corpus has 100 documents, and the word appears in 10 documents. the IDF is  $\log(100/10) \approx 2.3$ , so the TF-IDF for this document is  $.03 \times 2.3 = .07$ . Say the word appears in 90 out of 100 documents: Then the IDF is 0.105, with TF-IDF for this document equal to .003.

# Log Entropy Weighting

ightharpoonup log entropy weighted frequency for term i in document j is

$$local\_weight_{i,j} = log(frequency_{i,j} + 1)$$
 
$$P_{i,j} = \frac{frequency_{i,j}}{\sum_{j} frequency_{i,j}}$$
 
$$global\_weight_{i} = 1 + \frac{\sum_{j} P_{i,j} * log(P_{i,j})}{log(number\_of\_documents + 1)}$$
 
$$final\_weight_{i,j} = local\_weight_{i,j} * global\_weight_{i}$$

▶ Lee et al (2005) got best classification results using this weighting.

▶ In principle could include all these weightings as separate predictors.

- ▶ In principle could include all these weightings as separate predictors.
- ▶ Kelly et al (2019) suggest that including indicators for whether a phrase appears in a document (rather than the count) is often independently informative.

- ▶ In principle could include all these weightings as separate predictors.
- ► Kelly et al (2019) suggest that including indicators for whether a phrase appears in a document (rather than the count) is often independently informative.
- Could add log counts, quadratics in counts, etc.
- Could also add pairwise interactions between word counts/frequencies.

- ▶ In principle could include all these weightings as separate predictors.
- ▶ Kelly et al (2019) suggest that including indicators for whether a phrase appears in a document (rather than the count) is often independently informative.
- Could add log counts, quadratics in counts, etc.
- Could also add pairwise interactions between word counts/frequencies.
- ▶ These often are not done much because of the dimensionality problem.
  - could use feature selection or principal components to deal with that.

### Outline

Basic Text Processing

Counts and Frequencies

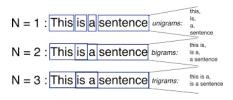

N-Grams

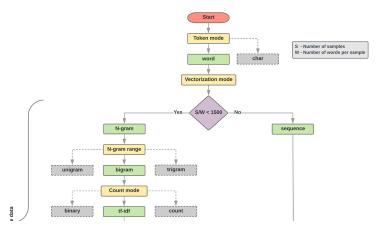

Parts of Speech

Applications

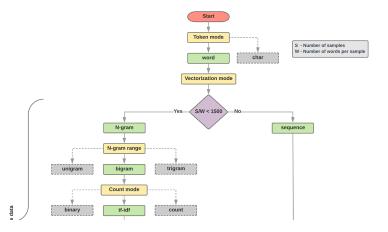

## What are N-grams

- $\triangleright$  N-grams are phrases, sequences of words up to length N.
  - bigrams, trigrams, quadgrams, etc.

- ► Google Developers recommend **tf-idf-weighted bigrams** as a baseline specification for text classification tasks.
  - ▶ ideal for fewer, longer documents.

- ► Google Developers recommend **tf-idf-weighted bigrams** as a baseline specification for text classification tasks.
  - ▶ ideal for fewer, longer documents.
- ▶ With more numerous, shorter documents (rows / doclength > 1500), better to use an embedded sequence (starting Week 5).

# N-grams and high dimensionality

- ▶ N-grams will blow up your feature space:
  - filtering out uninformative n-grams is necessary.

### N-grams and high dimensionality

- ► N-grams will blow up your feature space:
  - filtering out uninformative n-grams is necessary.
- ▶ Google Developers say that a feature space with P = 20,000 will work well for descriptive and prediction tasks.
  - ▶ I have gotten good performance with 10K or even 2K features.
  - ► For supervised learning tasks, a decent baseline is to build a vocabulary of 60K, then use feature selection to get down to 10K.

## Feature selection using univariate comparisions

- $\triangleright$   $\chi^2$  is a very fast feature selection routine for classification tasks
  - ▶ features must be non-negative
  - works on sparse matrices
  - works on multi-class problems

### Feature selection using univariate comparisions

- $\triangleright$   $\chi^2$  is a very fast feature selection routine for classification tasks
  - ▶ features must be non-negative
  - works on sparse matrices
  - works on multi-class problems
- With negative predictors:
  - use f\_classif.

### Feature selection using univariate comparisions

- $\triangleright$   $\chi^2$  is a very fast feature selection routine for classification tasks
  - ▶ features must be non-negative
  - works on sparse matrices
  - works on multi-class problems
- With negative predictors:
  - use f\_classif.
- ► For regression tasks:
  - use f\_regression or OLS coefficients.

- ► For f\_classif and f\_regression, can de-mean predictors by groups, for example by year or location.
  - for regression, can also de-mean the outcome.

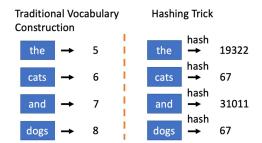

- ► For f\_classif and f\_regression, can de-mean predictors by groups, for example by year or location.
  - ▶ for regression, can also de-mean the outcome.
- What if you want to de-mean by both year and location?
  - $\, \to \,$  take residuals from OLS regression of each variable (outcome and predictor) on the category dummies.

- ► For f\_classif and f\_regression, can de-mean predictors by groups, for example by year or location.
  - for regression, can also de-mean the outcome.
- What if you want to de-mean by both year and location?
  - ightharpoonup take residuals from OLS regression of each variable (outcome and predictor) on the category dummies.
- ► That is:
  - regress  $Y_i = FE_1 + FE_2 + \epsilon_i$  and  $x_i^w = FE_1 + FE_2 + \epsilon_i, \forall w$ ,
  - ▶ take residuals  $\tilde{Y}_i = Y_i \hat{Y}_i$  and  $\tilde{x}_i^w = x_i^w \hat{x}_i^w$

- ► For f\_classif and f\_regression, can de-mean predictors by groups, for example by year or location.
  - for regression, can also de-mean the outcome.
- What if you want to de-mean by both year and location?
  - ightharpoonup take residuals from OLS regression of each variable (outcome and predictor) on the category dummies.
- ► That is:
  - regress  $Y_i = FE_1 + FE_2 + \epsilon_i$  and  $x_i^w = FE_1 + FE_2 + \epsilon_i, \forall w$ ,
  - ▶ take residuals  $\tilde{Y}_i = Y_i \hat{Y}_i$  and  $\tilde{x}_i^w = x_i^w \hat{x}_i^w$
- ► Then use residuals as variables, in feature selection step or in machine learning task.

## Hashing Vectorizer

- ► A very different approach to tokenizing documents:
  - rather than make a one-to-one lookup for each n-gram, put n-grams through a hashing function that takes an arbitrary string and outputs an integer in some range (e.g. 1 to 10,000).

## Hashing Vectorizer

- ► A very different approach to tokenizing documents:
  - rather than make a one-to-one lookup for each n-gram, put n-grams through a hashing function that takes an arbitrary string and outputs an integer in some range (e.g. 1 to 10,000).

Traditional Vocabulary Construction			Hashing Trick			
the	-	5		the	hash →	19322
cats	-	6		cats	hash →	67
and	<b>→</b>	7		and	hash →	31011
dogs	<b>→</b>	8		dogs	hash →	67

#### Pros:

- can have arbitrarilly small feature space
- ► handles out-of-vocabulary words any word or n-gram gets assigned to an arbitrary integer based on the hash function.

### Hashing Vectorizer

- A very different approach to tokenizing documents:
  - rather than make a one-to-one lookup for each n-gram, put n-grams through a hashing function that takes an arbitrary string and outputs an integer in some range (e.g. 1 to 10,000).

Traditional Vocabulary Construction			Hashir	ng Trick		
the	<b>→</b>	5	l	the	hash →	19322
cats	<b>→</b>	6		cats	hash →	67
and	<b>→</b>	7		and	hash →	31011
dogs	<b>→</b>	8		dogs	hash →	67

#### Pros:

- can have arbitrarilly small feature space
- ▶ handles out-of-vocabulary words any word or n-gram gets assigned to an arbitrary integer based on the hash function.

#### ► Cons:

- cannot interpret features
  - at least not directly could in principle keep track of the mapping
- will have collisions n-grams will randomly be paired with each other in the feature map.
  - usually innocuous, but could sum outputs of two hashing functions to minimize this.

## Collocations are Familiar N-grams

- Conceptually, the goal of including n-grams is to featurize collocations:
  - Non-compositional: the meaning is not the sum of the parts (kick+the+bucket≠"kick the bucket")

## Collocations are Familiar N-grams

- ► Conceptually, the goal of including n-grams is to featurize **collocations**:
  - Non-compositional: the meaning is not the sum of the parts (kick+the+bucket≠"kick the bucket")
  - Non-substitutable: cannot substitute components with synonyms ("fast food" ≠"quick food")

## Collocations are Familiar N-grams

- Conceptually, the goal of including n-grams is to featurize collocations:
  - Non-compositional: the meaning is not the sum of the parts (kick+the+bucket≠"kick the bucket")
  - Non-substitutable: cannot substitute components with synonyms ("fast food" ≠"quick food")
  - Non-modifiable: cannot modify with additional words or grammar: (e.g., "kick around the bucket", "kick the buckets")

► A metric for identifying collocations is point-wise mutual information:

$$\begin{aligned} \mathsf{PMI}(w_1, w_2) &= \frac{\mathsf{Pr}(w_1 \underline{\hspace{0.1cm}} w_2)}{\mathsf{Pr}(w_1) \mathsf{Pr}(w_2)} \\ &= \frac{\mathsf{Prob. of collocation, actual}}{\mathsf{Prob. of collocation, if independent}} \end{aligned}$$

where  $w_1$  and  $w_2$  are words in the vocabulary, and  $w_1, w_2$  is the N-gram  $w_1 w_2$ .

► A metric for identifying collocations is point-wise mutual information:

$$\begin{aligned} \mathsf{PMI}(w_1, w_2) &= \frac{\mathsf{Pr}(w_1 \underline{\hspace{0.1cm}} w_2)}{\mathsf{Pr}(w_1) \mathsf{Pr}(w_2)} \\ &= \frac{\mathsf{Prob. of collocation, actual}}{\mathsf{Prob. of collocation, if independent}} \end{aligned}$$

where  $w_1$  and  $w_2$  are words in the vocabulary, and  $w_1, w_2$  is the N-gram  $w_1 w_2$ .

ranks words by how often they collocate, relative to how often they occur apart.

► A metric for identifying collocations is point-wise mutual information:

$$\begin{aligned} \mathsf{PMI}(w_1, w_2) &= \frac{\mathsf{Pr}(w_1 \underline{\hspace{0.1cm}} w_2)}{\mathsf{Pr}(w_1) \mathsf{Pr}(w_2)} \\ &= \frac{\mathsf{Prob. of collocation, actual}}{\mathsf{Prob. of collocation, if independent}} \end{aligned}$$

where  $w_1$  and  $w_2$  are words in the vocabulary, and  $w_1, w_2$  is the N-gram  $w_1 w_2$ .

- ranks words by how often they collocate, relative to how often they occur apart.
- Warning: Rare words that appear together once or twice will have high PMI.

▶ A metric for identifying collocations is point-wise mutual information:

$$\begin{aligned} \mathsf{PMI}(w_1, w_2) &= \frac{\mathsf{Pr}(w_1 \underline{\hspace{0.1cm}} w_2)}{\mathsf{Pr}(w_1) \mathsf{Pr}(w_2)} \\ &= \frac{\mathsf{Prob. of collocation, actual}}{\mathsf{Prob. of collocation, if independent}} \end{aligned}$$

where  $w_1$  and  $w_2$  are words in the vocabulary, and  $w_1, w_2$  is the N-gram  $w_1 w_2$ .

- ranks words by how often they collocate, relative to how often they occur apart.
- Warning: Rare words that appear together once or twice will have high PMI.
  - Address this with minimum frequency thresholds.

### Geometric Mean: Normalized PMI for $N \ge 2$

 $\triangleright$  PMI can be generalized to arbitrary N as the geometric mean of the probabilities:

$$\frac{\Pr(w_1,...,w_N)}{\prod_{i=1}^n \sqrt[n]{\Pr(w_i)}}$$

## Geometric Mean: Normalized PMI for $N \ge 2$

 $\triangleright$  PMI can be generalized to arbitrary N as the geometric mean of the probabilities:

$$\frac{\Pr(w_1,...,w_N)}{\prod_{i=1}^n \sqrt[n]{\Pr(w_i)}}$$

► E.g., for trigrams:

$$\frac{\Pr(w_1, w_2, w_3)}{\sqrt[3]{\Pr(w_1)\Pr(w_2)\Pr(w_3)}}$$

## Geometric Mean: Normalized PMI for $N \ge 2$

 $\triangleright$  PMI can be generalized to arbitrary N as the geometric mean of the probabilities:

$$\frac{\Pr(w_1,...,w_N)}{\prod_{i=1}^n \sqrt[n]{\Pr(w_i)}}$$

► E.g., for trigrams:

$$\frac{\Pr(w_1, w_2, w_3)}{\sqrt[3]{\Pr(w_1)\Pr(w_2)\Pr(w_3)}}$$

► The *n*-root normalizer is not necessary (it does not change the ranking), but makes scores for bigrams/trigrams/quadgrams/etc. more comparable.

[VP/NN]	voted in favour of the draft	voted in favour of the	Equivalence

- ► The Paraphrase Database 2.0 (PPDB, paraphrase.org/#/download) has a large database of equivalent/related words/phrases.
  - could be used to make a vocabulary, or for dimension reduction.

### Domain dictionaries

- ► Could take wikipedia article names as lists of multi-word expressions.
  - ▶ in law, could use legal dictionaries (e.g., "first amendment", "beyond a reasonable doubt").

### Named Entity Recognition

refers to the task of identifying named entities such as "ETH Zurich" and "Marie Curie".

 $[_{\rm PER}$  John Smith ] , president of  $[_{\rm ORG}$  McCormik Industries ] visited his niece  $[_{\rm PER}$  Paris ] in  $[_{\rm LOC}$  Milan ], reporters say .

### BIO tags for named entity recognition

Tag	Meaning
O	Not part of a named entity
B-PER	First word of a person name
I-PER	Continuation of a person name
B-LOC	First word of a location name
I-LOC	Continuation of a location name
B-ORG	First word of an organization name
I-ORG	Continuation of an organization name
B-MISC	First word of another kind of named entity
I-MISC	Continuation of another kind of named entity

can tokenize named entities.

### Sub-Word Units

- Advanced NLP tasks (text generation, question answering) benefit from encoding sub-word information.
- ► Tokenizers like **SentencePiece** do tokenizing at the character level, with white space and punctuation treated equivalently to alphanumeric characters.
  - requires lots of data/compute but learns word endings etc

Parts of Speech

Applications

# Parts of speech tags

- ▶ Parts of speech (POS) tags provide useful word categories corresponding to their functions in sentences:
  - ► Eight main parts of speech: verb (VB), noun (NN), pronoun (PR), adjective (JJ), adverb (RB), determinant (DT), preposition (IN), conjunction (CC).
  - The Penn TreeBank POS tag set (used in many applications) has 36 tags:
    https://www.ling.upenn.edu/courses/Fall\_2003/ling001/penn\_treebank\_pos.html

# Parts of speech tags

- ▶ Parts of speech (POS) tags provide useful word categories corresponding to their functions in sentences:
  - ► Eight main parts of speech: verb (VB), noun (NN), pronoun (PR), adjective (JJ), adverb (RB), determinant (DT), preposition (IN), conjunction (CC).
  - The Penn TreeBank POS tag set (used in many applications) has 36 tags: https://www.ling.upenn.edu/courses/Fall\_2003/ling001/penn\_treebank\_pos.html
- ▶ Parts of speech vary in their informativeness for various functions:
  - For categorizing topics, nouns are usually most important
  - For sentiment, adjectives are usually most important.

# Parts of speech as features

- ► Can produce n-grams from parts of speech tags:
  - counts over NV, VN, AN, etc.

# Parts of speech as features

- Can produce n-grams from parts of speech tags:
  - counts over NV, VN, AN, etc.
- ▶ POS n-gam frequencies are good stylistic features for authorship detection.
  - not biased by topics/content
  - for function words, can use the word itself rather than the POS tag.

# Constructing "Memes" with POS

- A: Adjective, N: Noun, V: Verb, P: Preposition, D: Determinant, C: Conjunction.
- 2-grams: AN, NN, VN, VV, NV, VP.
  - tax credit, magistrate judge
- 3-grams: NNN, AAN, ANN, NAN, NPN, VAN, VNN, AVN, VVN, VPN, ANV, NVV, VDN, VVV, NNV, VVP, VAV, VVN, NCN, VCV, ACA, PAN.
  - armed and dangerous, stating the obvious

## Constructing "Memes" with POS

- A: Adjective, N: Noun, V: Verb, P: Preposition, D: Determinant, C: Conjunction.
- 2-grams: AN, NN, VN, VV, NV, VP.
  - tax credit, magistrate judge
- 3-grams: NNN, AAN, ANN, NAN, NPN, VAN, VNN, AVN, VVN, VPN, ANV, NVV, VDN, VVV, NNV, VVP, VAV, VVN, NCN, VCV, ACA, PAN.
  - armed and dangerous, stating the obvious
- 4-grams: NCVN, ANNN, NNNN, NPNN, AANN, ANNN, ANPN, NNPN, NPAN, ACAN, NCNN, NNCN, ANCN, NCAN, PDAN, PNPN, VDNN, VDAN, VVDN.
  - Beyond a reasonable doubt (preposition, article, adjective, noun)
  - Earned income tax credit (adjective, noun, noun, noun)

#### How to set statistical thresholds

- ▶ Potentially complex thresholds for vocabulary inclusion based on frequency, parts of speech, and point-wise mutual information.
  - could use domain dictionaries as a source for tuning these statistics.

Parts of Speech

**Applications** 

# Ranking Partisan language:

Monroe et al (2009)

- ► This paper systematically explores a number of methods for identifying words that are distinctive of groups of speakers
  - in this case, whether U.S. congressmen are Republicans are Democrats.

## Ranking Partisan language:

Monroe et al (2009)

- ► This paper systematically explores a number of methods for identifying words that are distinctive of groups of speakers
  - in this case, whether U.S. congressmen are Republicans are Democrats.
- First, they separate speeches by topic using latent dirichlet allocation (next lecture).
  - they then test a number of methods for ranking partisanship of words.

#### Relative Frequency of Words

# Partisan Words, 106th Congress, Abortion (Difference of Proportions) to women 0.005 • to $f_{kw}^{(D)} - f_{kw}^{(R)}$ -0.005 babi abort the 100 10000 Frequency of Word within Topic

Fig. 1 Feature evaluation and selection using  $f_{kw}^{(0)} - f_{kw}^{(R)}$ . Plot size is proportional to evaluation weight,  $f_{kw}^{(0)} - f_{kw}^{(R)}$ . The top 20 Democratic and Republican words are labeled and listed in rank order to the right. The results are almost identical for two other measures discussed in the text: unlogged t/tdt and frequency-weighted WordScores.

#### Log Odds Ratio Between Groups

## Partisan Words, 106th Congress, Abortion (Log-Odds-Ratio, Smoothed Log-Odds-Ratio)

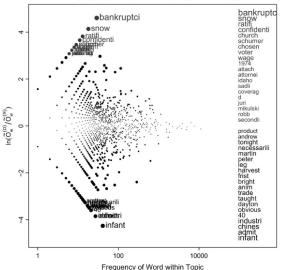

Fig. 2 Feature evaluation and selection using  $\delta_{lor}^{(D-R)}$ . Plot size is proportional to evaluation weight,  $\left|\delta_{lor}^{(D-R)}\right|$ . Top 20 Democratic and Republican words are labeled and listed in rank order. The results are identical to another measure discussed in the text: the log-odds-ratio with uninformative Dirichlet prior.

#### Bayesian Multinomial Model

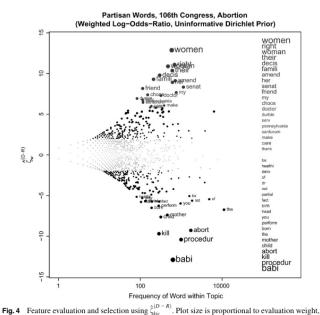

Fig. 4. Feature evaluation and selection using  $s_{biw}$ . Plot size is proportional to evaluation weight  $\left| \frac{\zeta_b^{(D-R)}}{\zeta_{biw}} \right|$ ; those with  $\left| \frac{\zeta_b^{(D-R)}}{\zeta_b^{(D-R)}} \right|$ <1.96 are gray. The top 20 Democratic and Republican words are labeled and listed in rank order to the right.

#### Bayesian Multinomial Model, LaPlace Prior

# Partisan Words, 106th Congress, Abortion (Log-Odds-Ratio, Laplace Prior)

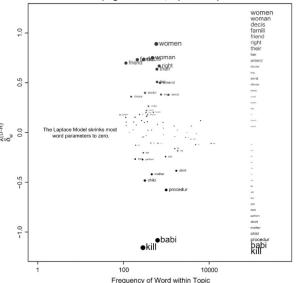

Fig. 6 Feature evaluation and selection using  $\hat{\delta}_{kw}^{(D-R)}$ . Plot size is proportional to evaluation weight,  $\hat{\delta}_{kw}^{(D-R)}$ . The top 20 Democratic and Republican words are labeled and listed in rank order to the right.

- ► Corpora:
  - news text from large sample of US daily newspapers.
  - congressional text is 2005 Congressional Record.

- Corpora:
  - news text from large sample of US daily newspapers.
  - congressional text is 2005 Congressional Record.
- Pre-process text, stripping away prepositions, conjunctions, pronouns, and common words
  - get bigrams and trigrams

- Corpora:
  - news text from large sample of US daily newspapers.
  - congressional text is 2005 Congressional Record.
- Pre-process text, stripping away prepositions, conjunctions, pronouns, and common words
  - get bigrams and trigrams
- ▶ Identify polarizing phrases using  $\chi^2$  metric. For each phrase w, let  $D_w$  be frequency for Democrats,  $R_w$  be frequency for Republicans. Let  $D_w^-$  and  $R_w^-$  be frequencies of *other* phrases.
- ► Then:

$$\chi_w^2 = \frac{(R_w D_w^- - D_w R_w^-)^2}{(D_w + R_w)(D_w + D_w^-)(R_w + R_w^-)(D_w^- + R_w^-)}$$

- this is the test statistic for equality between parties of phrase use if they were both drawn from multinomial distributions.
- in sklearn, it is feature\_selection.chi2

**meme score** for phrase *m* from Kuhn et al (2014) is

# Detecting Memes with Citation Networks

Kuhn, Perc, and Helbing (2014); Chen, Parthasaratha, and Verma (2017)

**meme score** for phrase m from Kuhn et al (2014) is

$$M_m = f_m P_m$$

- frequency of m,  $f_m = \frac{\# \text{ cases mentioning } m}{\# \text{ total cases}}$
- $\triangleright$  Propagation score for m:

$$P_m = \underbrace{\frac{d_{m \to m}}{d_{\to m}}}_{\text{"sticking"}} / \underbrace{\frac{d_{m \to m'}}{d_{\to m'}}}_{\text{"sparking"}}.$$

- "sticking factor":
  - ▶  $d_{m\to m}$ , # cases with m that cite a case with m, divided by
  - $ightharpoonup d_{\rightarrow m}$ , # cases without m that cite a case with m
- "sparking factor":
  - $d_{m o m'}$ , # cases with m that do not cite a case with m, divided by
  - $ightharpoonup d_{\rightarrow m'}$ , # cases without m that do not cite a case with m

# Loan Application Words Predicting Repayment (Netzer, Lemaire, and Herzenstein 2019)

# Loan Application Words Predicting Repayment (Netzer, Lemaire, and Herzenstein 2019)

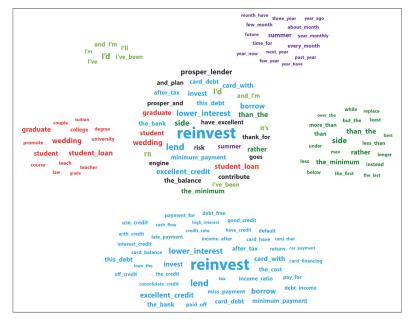

Figure 2. Words indicative of loan repayment.

#### Loan Application Words Predicting Default (Netzer, Lemaire, and Herzenstein 2019)

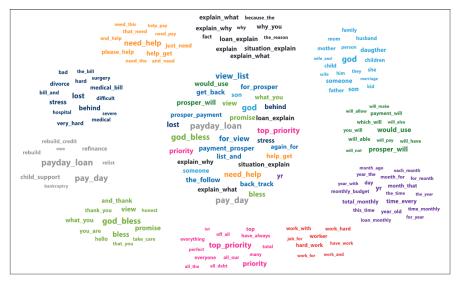

Figure 3. Words indicative of loan default.

Notes: The most common words appear in the middle cloud (cutoff = 11.5) and are then organized by themes. Starting on the top and moving clockwise: words related to explanations, external influence words and others, future-tense words, time-related words, work-related words, extremity words, words appealing to lenders, words relating to financial hardship, words relating to general hardship, and desperation/plea words.

# Outline

 ${\sf Appendix}\ {\sf Slides}$ 

# Computing Geometric Mean with N-gram Counts

▶ Probability of a token is the frequency in the corpus:

$$\Pr(w_1) = \frac{\mathsf{Count}(w_1)}{\sum_{i=1}^{P} \mathsf{Count}(w_i)}$$

where P is vocabulary size.

# Computing Geometric Mean with N-gram Counts

Probability of a token is the frequency in the corpus:

$$\Pr(w_1) = \frac{\mathsf{Count}(w_1)}{\sum_{i=1}^{P} \mathsf{Count}(w_i)}$$

where P is vocabulary size.

▶ Let  $f_i = Count(w_i)$  and  $F = \sum_{i=1}^{P} f_i$ . Then we have

$$\mathsf{PMI}(w_1, w_2) = \frac{\mathsf{Pr}(w_1, w_2)}{\mathsf{Pr}(w_1) \, \mathsf{Pr}(w_2)} = \frac{\frac{f_{12}}{F}}{\frac{f_1}{F} \cdot \frac{f_2}{F}} = \frac{1}{F} \frac{f_{12}}{f_1 f_2}$$

# Computing Geometric Mean with N-gram Counts

▶ Probability of a token is the frequency in the corpus:

$$\Pr(w_1) = \frac{\mathsf{Count}(w_1)}{\sum_{i=1}^{P} \mathsf{Count}(w_i)}$$

where P is vocabulary size.

▶ Let  $f_i = \text{Count}(w_i)$  and  $F = \sum_{i=1}^{P} f_i$ . Then we have

$$PMI(w_1, w_2) = \frac{Pr(w_1, w_2)}{Pr(w_1)Pr(w_2)} = \frac{\frac{f_{12}}{F}}{\frac{f_1}{F} \cdot \frac{f_2}{F}} = \frac{1}{F} \frac{f_{12}}{f_1 f_2}$$

Note that the leading  $\frac{1}{F}$  does not affect the ranking of bigrams, and cancels out with the geometric mean formula:

$$\mathsf{gmean}(w_1, w_2) = \frac{\mathsf{Pr}(w_1, w_2)}{\sqrt{\mathsf{Pr}(w_1)\mathsf{Pr}(w_2)}} = \frac{\frac{f_{12}}{F}}{\sqrt{\frac{f_1}{F} \cdot \frac{f_2}{F}}} = \frac{f_{12}}{\sqrt{f_1 f_2}}$$

- ▶ Similarly, it cancels out for N > 2.
- ► Therefore PMI can be computed directly from term counts (rather than frequencies).
